MARCO OFFICE SUPPLY, FURNITURE & PRINTING, INC.

IT IS NOT OVER YET...

The vaccine is here however a large majority will not have the opportunity or availability for quite some time. It is no secret the first group and age range were our medical personnel, first responders and those over the age of 65. There has been no established time frame on when the next grouping will be announced for the immunization. The buzz word is the teen and twenty somethings have been considered the next age group most likely to intermix and spread the virus. It is still undetermined.

It is our job to give and at the utmost importance, our customers, a peace of mind by making sure your business takes steps to ensure their health and safety. First let's examine how long the virus can survive on different surfaces.

Copper----- 4 hours

Cardboard-----24 hours

Plastic and Stainless Steel -----3 days

Wood-----4 days

Glass----- 5 days

MISTAKES BEING MADE BY BUSINESSES:

1. Believing that spraying down your facility or business once a week by your staff or a company is virus free. Here is the honest to plan truth... once I have touched that surface, even for a second it is contaminated!!!
2. Read your labels or do your research on what virus and bacteria the product kills. We can all say, "X product kills 99% of all viruses". It is called product marketing. What you want is

facts. What type of viruses will it kill?

3. Kill times – Most users are in the habit of spray and wipe. Except for a few products, most products must be left on between 5 – 10 minutes to be considered effective.
4. We tend to forget high traffic areas to disinfect which are doorknobs, elevator buttons, and light switches.

WHAT CAN WE DO TO RESOLVE THESE CONCERNS?

- Best precautions are using the right product for the right surface or area.
- Consider UV- Lighting in between room usage in classrooms, labs, patient rooms or end of the day cleaning.
- Consider spray misting where you aren't required to wipe down surfaces, furniture, table tops and equipment.
- Place UV lighting in common areas such as lobbies, waiting rooms, classrooms for clean air circulation.
- Spray Drones – For large areas such as warehouses and production areas. Outside venues such as stadiums, playgrounds in parks.

CONTACT MARCO OFFICE SUPPLY

and ask for a Sales Representative to find the best solutions that fit your needs.

We carry those products mentioned above and more.

UV ANGEL ADAPT™

SURFACE PATHOGEN CONTROL

A growing volume of science points to shared workstations as fomites for pathogen transmission. Studies have shown the presence of HAI-related pathogens on 1 in 4 frequently touched surfaces.

Reduce the risk of spreading viruses and bacteria with an intelligent, automated UV-C that safely and continuously detects and neutralizes surface contamination. It's called the UV Angel Adapt™.

High Touch, High Risk

The spread of contamination has become a critical problem in environments from hospitals to corporate offices, retail locations, restaurants, coffee shops, dental clinics, hotels and more.

How it Operates

Using an intelligent, automated UV-C light treatment platform, the UV Angel Adapt™ continuously monitors when surfaces have been used and safely treats them hundreds of times a day with no assistance from staff. The moment a potential threat is detected on surfaces, the UV Angel Adapt™ neutralizes it at a cellular level, at rates greater than 99%.
